

Fluoride Observations

As has been mentioned in a previous paper of this report it was decided to take  
from time to time a complete set of analytical measurements. I took with me however a tin case  
filled with which contained a few (in total) Chlorine  
I should like to mention that the results of the analysis of the water  
of each sample (taken at different times) were very different. I have  
never before seen such a variation in the amount of fluoride  
found in the water of a single locality. It is therefore  
very probable that the variation is due to the fact  
that the water is not pure but contains a  
small amount of fluoride which is  
absorbed by the water.

The amount of fluoride found in the water  
of the different localities was very different.
